## 18. Write a Python program to read an entire text file.

```
Write a Python program to read an entire text file.
def read_file():
    file_name = input("Enter the file name: ").strip()
    try:
        # Safely opens the file and ensures it closes automatically
        with open(file_name, 'r') as file:
            # Read the entire content
            content = file.read()
            # Print the content
            print("\n ✓ File Content:\n")
            print(content)
    except FileNotFoundError:
        print("X Error: File not found. Please check the file name and path.")
    except Exception as e:
        print(f" X An error occurred: {e}")
read_file()
```
